

# Audiovisual Colour-Word Stroop Matching Task: Interference but not Facilitation from Written Word Meaning

Ido Bornstein and Anthony Herdman, University of British Columbia

## Introduction

Visual matching Stroop<sup>1</sup> tasks require judging whether a colour-word's meaning is the same as or different from a reference colour bar<sup>2,3</sup>:

Previous audiovisual Stroop studies<sup>4,5,6</sup> used spoken words mainly as distractors in a colour-naming task, and thus did not require attending to and matching stimuli across modalities.

### Objective

To explore how written word meaning affects audiovisual matching of a spoken colour-word and font colour.

### Hypothesis

Two hypotheses can account for interference to matching:

1. **Semantic-conflict** – between semantic representations of colour:

2. **Response-conflict** – between responses (“same” vs. “different”) to a task-relevant comparison (spoken word – font colour), and to two task-irrelevant comparisons (written word – font colour, and written word – spoken word):

## Methods

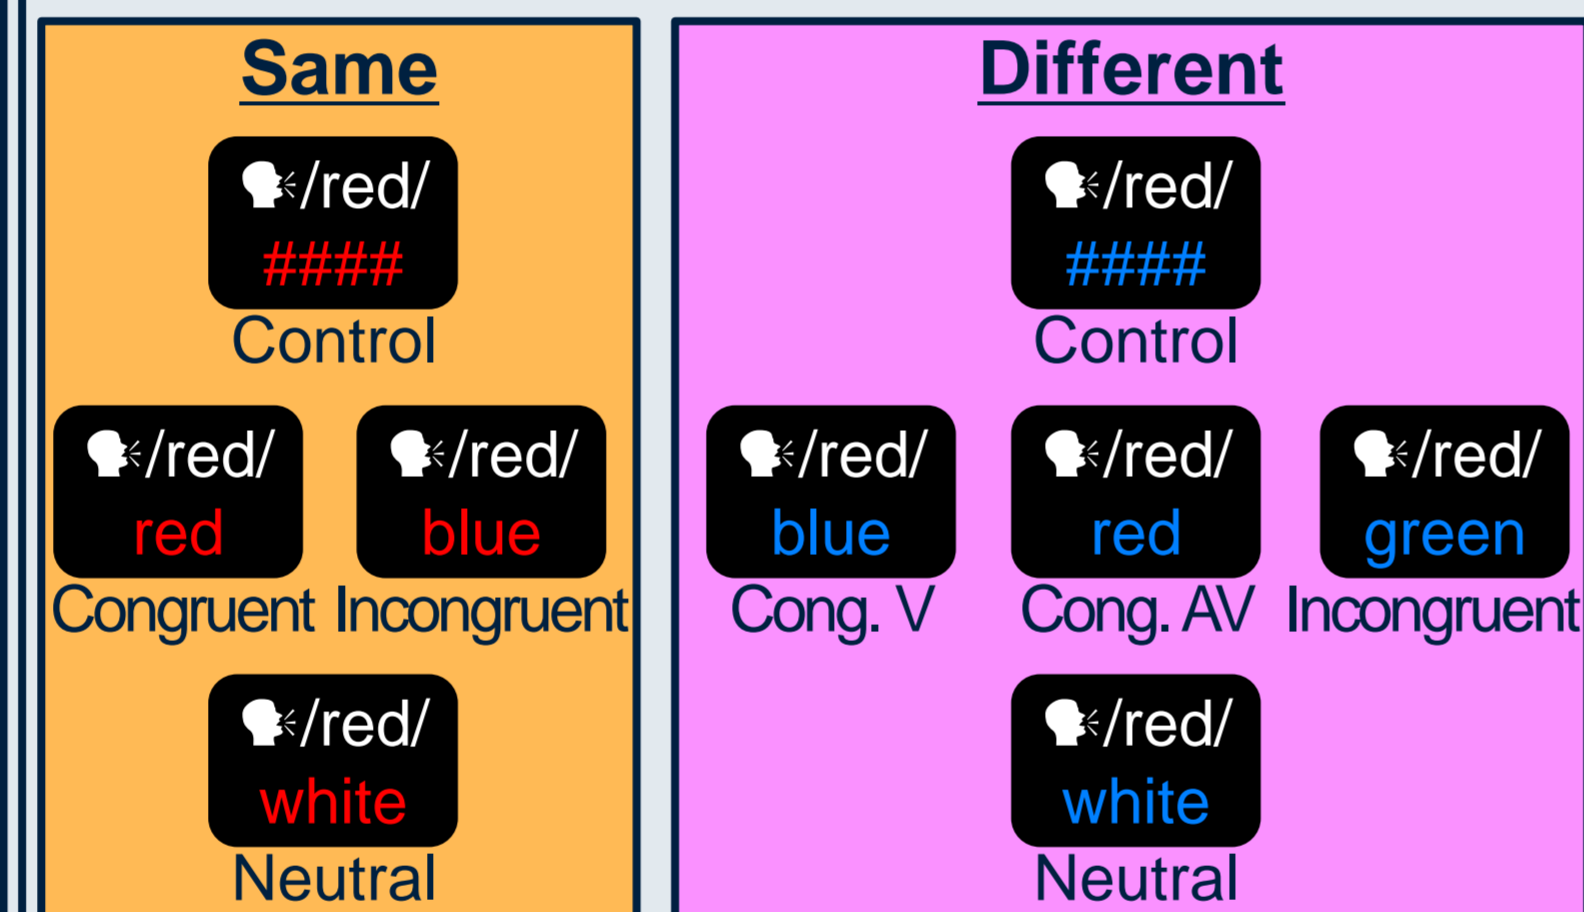

### Participants

- 28 young adults ( $M = 24$  years,  $SD = 3$ )
- English first language

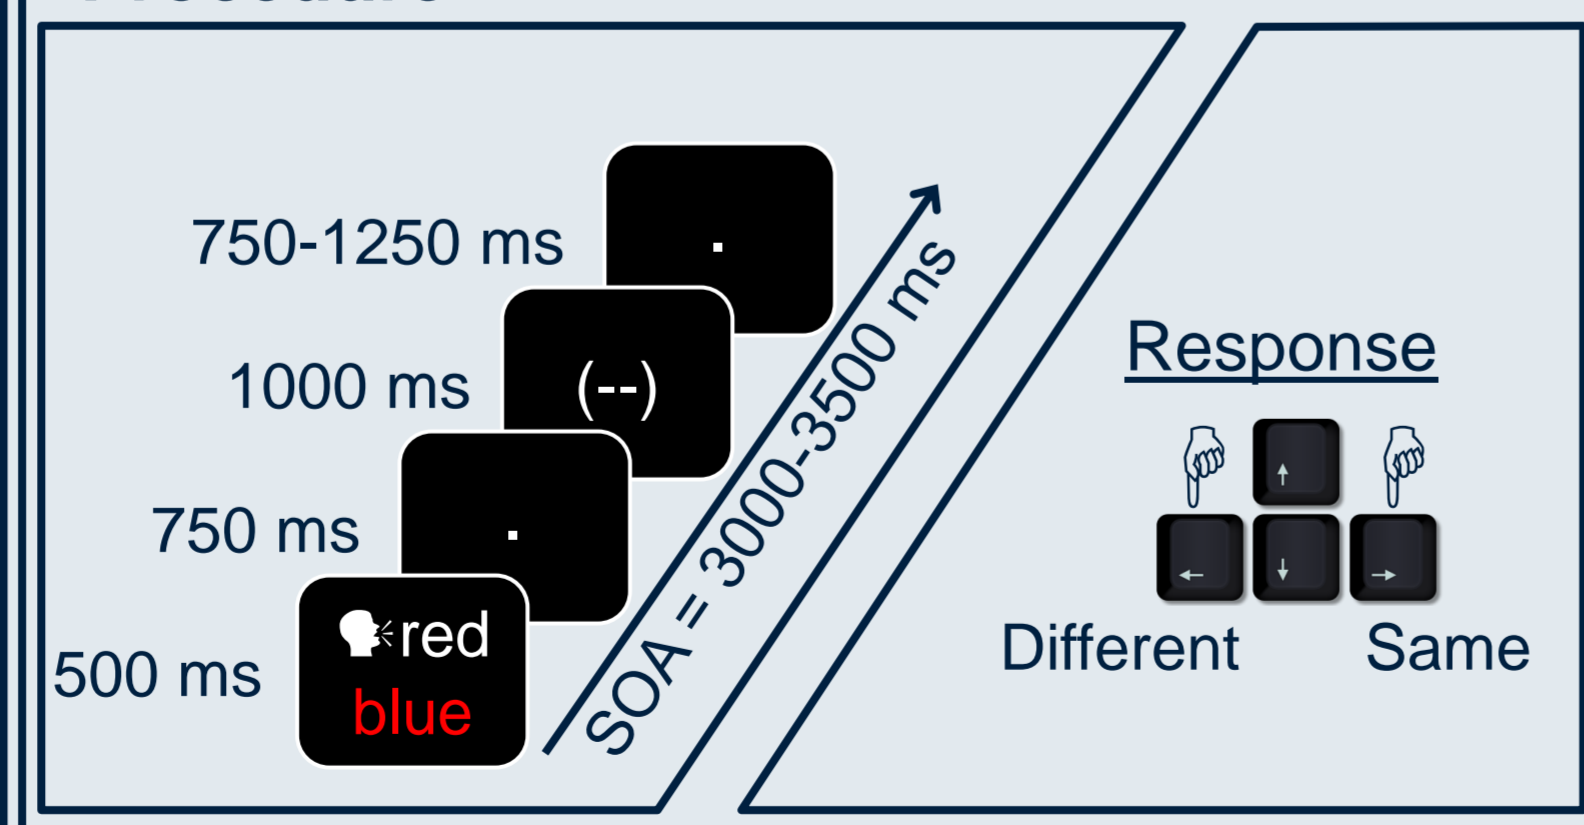

### Materials

- Written words: *red, green, blue, white, #####*
- Font colours: ■ ■ ■
- Spoken words: /red/, /green/, /blue/

### Conditions

### Procedure

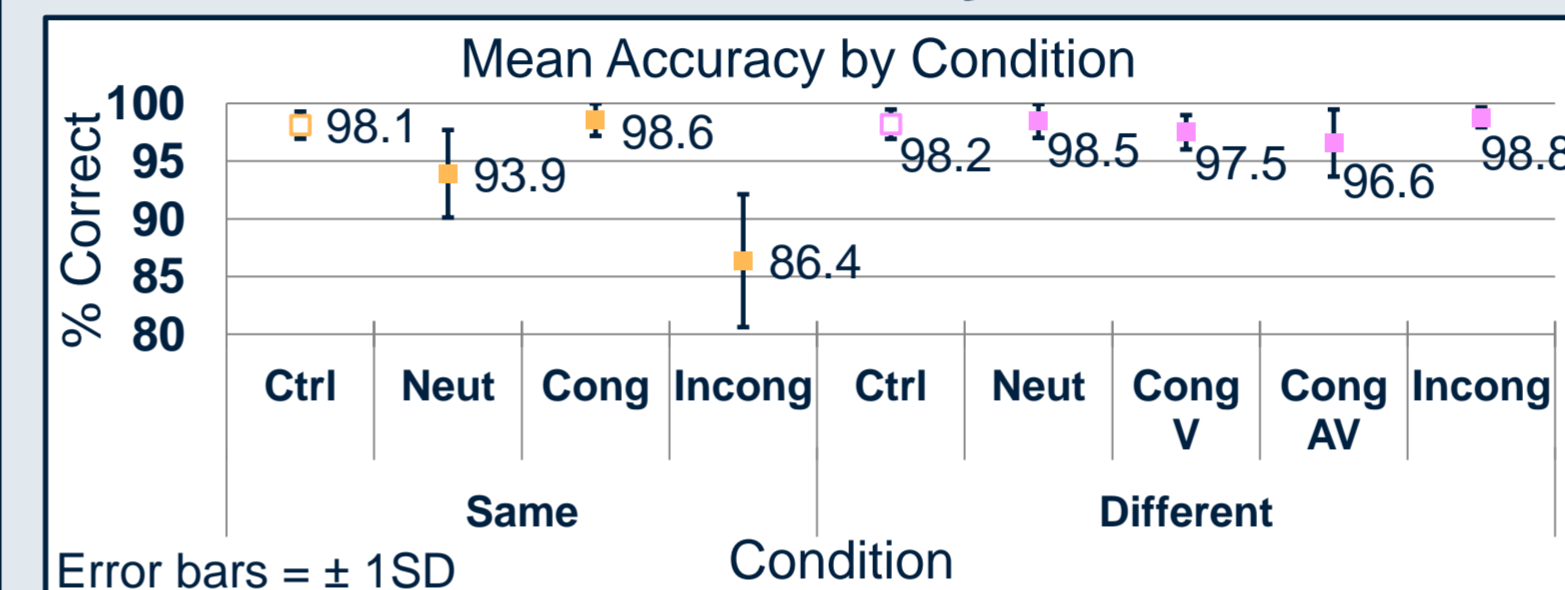

## Results

Response-conflict hypothesis ✓

Semantic-conflict hypothesis ✗

### Accuracy

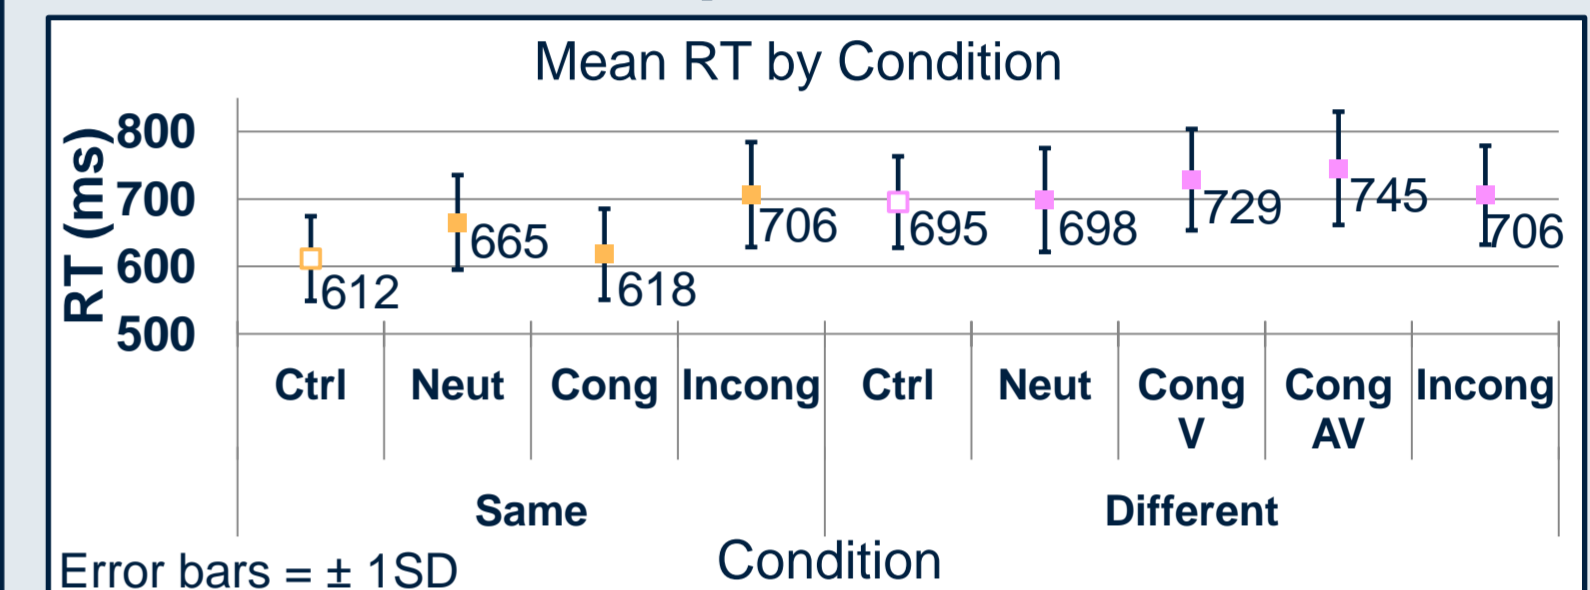

### Experimental-Control Accuracy Differences

\*  $p < .05$ ; \*\*  $p < .001$

### Response Time

### Experimental-Control RT Differences

\*  $p < .05$ ; \*\*  $p < .001$

## Summary

- Written word meaning interfered with but did not facilitate audiovisual judgments.
- Interference seemed to result from a conflict between the outcomes<sup>7</sup> (“same” vs. “different” judgment) of task-relevant and task-irrelevant comparisons.
- Incongruent semantic representations that elicited concurring outcomes (i.e., all “different”) did not produce interference.
- Outcome-conflicts seemed to produce delays by imposing serial processing of comparisons while non-conflicting outcomes allowed for parallel processing.
